

How to Disable the Windows 11 Login Screen After Reboot

By default, Windows 11 asks for your password or PIN every time you restart or wake from sleep. You can turn this off so the computer boots straight to the desktop.

Before you start: This is best suited for a personal computer in a private home. Skipping the login screen means anyone with physical access to your PC can use it without a password.

Method 1 — Using the Run Dialog (Fastest)

1. Press **Windows + R**
2. Type `netplwiz` and press **Enter**
3. In the **User Accounts** window, select your username
4. **Uncheck** the box that says *"Users must enter a user name and password to use this computer"*
5. Click **Apply**
6. Enter your current password twice when prompted and click **OK**
7. Restart to confirm it works

Method 2 — Through Settings

1. Go to **Settings → Accounts → Sign-in options**
2. Under **Additional settings**, set *"If you've been away, when should Windows require you to sign in again?"* to **Never**

To Re-Enable the Login Screen

Reverse the steps above — recheck the box in `netplwiz` or set the sign-in option back to your preferred time.

Note: If your PC uses a **Microsoft account** (not a local account), Method 1 may not show the checkbox. In that case you'd need to switch to a local account first, or use Method 2 only.
